AI Website Chatbot Documentation

This is a simple AI RAG chatbot project. It works in two ways.

First is normal chat. AI answers like normal assistant.
Second is website chat. AI reads website content and answers question from that website.

User must signup and login first. Login gives JWT token. Token is needed for adding website and chatting. User can add website by giving URL. Backend scrapes website, removes menus and scripts, splits text into small parts, makes embeddings and stores in vector database.

User can ask AI questions. If website data exists, RAG pipeline is used. Question is converted to embedding, top chunks are searched, context and question sent to AI, answer is returned. If no website data, normal AI reply is used. All chat is saved in database with user id, message, response and mode (general or website).

Frontend uses Streamlit. It has dark theme and chat bubbles. Sidebar has signup, login, add website and chat. Previous chat is shown and AI shows loading while thinking.

Errors faced:

bcrypt password longer than 72 bytes fixed by changing version

normal chat working without login fixed by adding token check

streamlit CSS issues fixed with markdown bubbles.

Some screenshots of the chatbot are also attached.

AI Answer

This web refers to a reconstruction of an early YouTube watch page, featuring the first-ever upload, "Me at the zoo." It captures YouTube as it appeared on December 8, 2006. The exhibit is opening on February 18 at V&A and was developed by the museum alongside YouTube's UX team and interaction design studio oio. It showcases the early designs of elements that continue to shape the internet today, such as badges, rating buttons, and sharing and recommendation features. The "Me at the zoo" clip, a 19-second video of YouTube co-founder Jawed Karim filmed in 2005, is considered a foundational moment in the rise of user-generated content.
